

29 Oct 2022

To whom it may concern,

I am a post graduate computer science student with a background in mechanical engineering. My last term result was 82% with 90% in programming and DSA. I'm applying for the software engineering program because of my interest in software development and programming.

About me

I like to solve challenging problems and building new things. I've often been told that I am a quick learner and that I think out of the box. I have programming experience in C, C++, Java, JavaScript, SQL, python, Lua and as of lately I've been programming in Rust. Rust, being a systems programming language, has created in me an interest for low-level systems programming and hardware hacking. I'm also learning embedded systems and I plan to use Rust as a programming language as a learning tool.

I like to take initiative and coordinate with my team. I always strive to increase team productivity and efficiency. In most of my experience working in a team, I've always taken initiative and as a result found myself leading the group in achieving the task at hand. I constantly apply methods and techniques in my life in order to improve my productivity and also learn from others experience.

Why I'm applying for this role

I'm applying for at JET because it is a great opportunity for me to grow my career and learn from highly experienced and skilled people. JET is known for offering its world class customer service and loved by millions of people worldwide. I look forward to connecting with brilliant and amazing people at JET.

I look forward to hearing from you and thank you for your consideration.

Sincerely,

Ashish R. Sonwane
